

Manage My Bastion

What is it?

An Azure managed application that allows you to schedule when your bastion is turned on and when it is turned off.

Our Azure managed application installs the ManageMyBastion service into your tenant in its own resource group.

Prerequisites:

ManageMyBastion has the following minimum requirements to adopt our service.

On installation you will need to select a Standard Azure Application Service Plan or greater (i.e. Premium, etc).

Once ManageMyBastion is installed, someone with Azure administration privileges will then need to grant the role of "Network Contributor" to the newly installed functions and newly installed ManagedApp.

Implementation:

Once installed, the scheduling options are maintained through a 6 character CRON notation. This notation allows daily/weekly configuration of the hour/minute that your Azure Bastion is either turned off with your OffSchedule CRON value or turned on with your OnSchedule CRON value.

You can also as when and required, turn on and turn off your Azure Bastion from the main page of the managed application.
